WeatheRoo

1. Introduction

I'm going to make a weather search application which will helps users to find the weather information by adding their city or country. I'll try to combine two API and make them work together. Mainly it will give clear weather information than other weather apps.

2. Expected List of Features

1. Search weather info based on your country

2. Search weather info based on your city

3. It will have multiple routes using node.js

4. Animations for showing the weathers

5. Forecast for upcoming 2 weeks

6. Front end with styled UI components and handlebars view engine

3. Market Survey

Currently there are many apps which provide the weather information does not support good forecast support so I'm trying to add that.
